

Class 3 NetFlix Application Deploy on Any Computer

Requirement: Deploy NetFlix Application on Any Computer

How to Install IIS Webserver On Windows 10

Open Google-How to Install IIS Webserver On Windows 10

Part 1 – Installing IIS on Windows 10

To install **Internet Information Services (IIS)** on a Windows 10 client device, first, click on the search bar and **type “Control Panel”** (1) and **click on the app** that appears in the results (2).

Next, **double-click on Programs and Features** (3).

A new window will appear. **Click on “Turn Windows features on or off”** (4).

Another window will now appear showing a list of features. **Search the list to find Internet Information Services**, expand the options and **select the options you wish to install** (5). The following options will be selected by default:

- Web Management Tools.
- World Wide Web Services.

“FTP Server” will be unchecked by default, but you can select it if you want to include it.

Once you’ve selected the options you want to install, **click on OK** (6) to begin the installation. You will then see a window with a progress bar until the process has finished.

There’s no need to restart your system to begin using the service, but we recommend it to clear the installation buffers, etc. and ensure the best performance.

Part 2 – Checking That IIS Has Been Installed Correctly

Now that the installation process has finished, it’s time to check that it has been installed correctly. First, **open your web browser** and type **“127.0.0.1”** in the address bar (7), which, if everything has run smoothly, will show the information loaded from the web server.
